

## Clusters, halos and S-factors in fermionic molecular dynamics

*Thursday, 5 December 2013 16:15 (20 minutes)*

Light nuclei are studied within the Fermionic Molecular Dynamics model. An effective interaction based on the Argonne V18 interaction is used for all nuclei. Short-range central and tensor correlations are treated explicitly using a unitary correlation operator. The evolution of cluster structures and halos with increasing neutron or proton number or excitation energy is discussed. The astrophysical S-factor is calculated for  ${}^3\text{He}(\alpha,\gamma){}^7\text{Be}$  radiative capture reaction in a fully microscopic fashion. Other applications are the Hoyle type states in  ${}^{12}\text{C}$  above the 3 alpha threshold or the two proton halo state in  ${}^{17}\text{Ne}$ .
