Abstract: With the advent of new facilities for radioactive ion beams mainly rich in neutrons, SPES @ LNL, FRAISE @ LNS and FAIR @ GSI only to give some examples, the detection of neutrons among charged particles in Heavy radioactive lon collisions became mandatory, with high angular and energy resolutions, and the construction of new detection systems suitable for this esperimenta purpose became important. The contribution will illustrate the results of recent tests performed on new plastic material the EJ276 both in the "green-shifted" and in the ordinary version, coupled with PMT and Si-PMT. These experimental works are aimed at the construction of a prototype of a detector for neutrons and charged particles with high energy and angular resolution [1,2,3].
