

Twenty years ago in an experiment at Brookhaven National Laboratory, physicists measured the muon's anomalous magnetic moment,  $a_{\mu} = (g_{\mu} - 2)/2$ , with a remarkable precision of 0.54 parts per million. Since then, the standard model prediction for  $a_{\mu}$  has exhibited a discrepancy with experiment of over 3 standard deviations, raising the tantalising possibility of physical particles or forces as yet undiscovered. On April 7 a new experiment at Fermilab presented its first results, brilliantly confirming Brookhaven's measurement and bringing the discrepancy with the standard model to a near discovery level of 4.2  $\sigma$ . To fully leverage this and future measurements, and possibly claim the presence of new fundamental physics, it is imperative to check the standard model prediction with independent methods, and to reduce its uncertainties. After an introduction and a discussion of the current experimental and theoretical status of  $a_{\mu}$ , I will present a precise lattice QCD calculation, by the BMW collaboration, of the contribution to this quantity that most limits the precision of the standard model prediction. The result of this calculation significantly reduces the gap between the standard model and experiment, and suggests that new physics may not be needed to explain the current, experimental, world-average value of  $a_{\mu}$ .

Wits ICPP/iThemba LABS SEMINAR in Particle Physics Prof. Laurent Lellouch, CNRS & Aix-Marseille U. Muon g-2 in the standard model and a lattice QCD calculation of the leading hadronic contribution

> Wednesday 21 July 2021 14:30 - 15:30 SAST (CET)

> > Zoom Link

Meeting ID: 626 9233 5383 Passcode: 118966

## rof. Laurent Lellouch

An exceptional theoretical particle physicist (PhD from MIT) and fellow in theory division at

CERN, where his work focuses on the theory of **QCD.** Since 2011 he is advisor of scientific computing, data & open science at INP, CNRS; is Head of the Theoretical particle physics team and research director at CNRS since 2006. He is also a member of the Particle Data Group and responsible for the section of quark masses. With h-index of 47, he published 52 refereed articles including 2 in Science, in Nature, 6 in Phys. Rev. Lett. (With 1 "Editors' Selection"). [http://www.cpt.univ-mrs.fr]
