

Property measurements of the Higgs-like Boson from CMS

Tuesday, 4 December 2012 16:30 (30 minutes)

Earlier this year a new boson with a mass of around 125 GeV was discovered at the LHC. Though it is compatible with the long sought-after Higgs boson only precise measurements of its properties will confirm this. The latest results from CMS on measurements of the properties of the new boson, derived from a study of all production and decay channels measured so far, will be presented together with prospects for the future.

Presentation Type

parallel

Primary author: Dr HAYS, Jonathan (Queen Mary University London)

Presenter: Dr HAYS, Jonathan (Queen Mary University London)

Session Classification: Parallel Session VI: Standard Model Higgs
