

Heavy Ion Physics from the CMS Collaboration

Friday, 7 December 2012 10:45 (45 minutes)

The talk presents recent results on collisions involving Pb ions from the CMS Experiment at the LHC. Results include jet quenching and jet modification studies; suppression of the production of J/psi and Y particles and their excited states; electroweak boson production; and global and collective features of heavy ion collisions, such as various distributions and azimuthal asymmetry of the final state charged particles.
