

Heavy ion physics at LHCb

Wednesday, 3 December 2014 12:45 (45 minutes)

The LHCb collaboration studied the production of J/ψ and Upsilon mesons in proton-lead collisions at a proton nucleon centre-of-mass energy $\sqrt{s_{NN}} = 5$ TeV. The measurements have been used to determine the nuclear modification factor and to compare the results with theoretical predictions. A measurement of Z boson production in proton-lead collisions is presented as well. The analyses are based on a data sample corresponding to an integrated luminosity of about 1 nb⁻¹.
