

Exclusive quarkonia production in the forward acceptance at the LHC

Thursday, 4 December 2014 15:00 (30 minutes)

The LHCb detector and LHC running conditions are ideally suited for measuring central exclusive production. Measurements of inclusive and differential cross-sections of the exclusive production of J/Ψ and $\Psi(2S)$, as well as double charmonium, are presented. The measurements are compared to different models as well as to photoproduction results from HERA and fixed target experiments.
