Heavy flavour spectroscopy at LHCb (including exotic states)

Monday, 3 December 2018 16:00 (20 minutes)

We report on recent heavy flavour spectroscopy results at LHCb. These comprise: the measurement of the branching ratio of the rare $B(s) \rightarrow J/\Psi p \text{ anti-}p$ decay and the precise B_s mass measurement, the search for excited Σ_b states, the production cross-section of Upsilon mesons at $\sqrt{s}=13$ TeV, and a search for tetraquark states in $B^0 \rightarrow \eta_c(1S) K \pi$ -decays.
